1 General Description

The Holtek HT32F54231/HT32F54241/HT32F54243/HT32F54253 devices are high performance, low power consumption 32-bit microcontrollers based around an Arm® Cortex®-M0+ processor core. The Cortex®-M0+ is a next-generation processor core which is tightly coupled with Nested Vectored Interrupt Controller (NVIC), SysTick timer and including advanced debug support.

The devices operate at a frequency of up to 60 MHz with a Flash accelerator to obtain maximum efficiency. It provides up to 128 KB of embedded Flash memory for code/data storage and up to 16 KB of embedded SRAM memory for system operation and application program usage. A variety of peripherals, such as as Hardware Divider DIV, PDMA, ADC, I²C, USART, UART, SPI, GPTM, SCTM, BFTM, MCTM, CRC-16/32, RTC, WDT, Touch key, LED controller and SW-DP (Serial Wire Debug Port), etc., are also implemented in the device series. Several power saving modes provide the flexibility for maximum optimization between wakeup latency and power consumption, an especially important consideration in low power applications.

The above features ensure that the devices are suitable for use in a wide range of applications, especially in areas such as washing machines, refrigerators, electric pressure cookers, high-speed blenders, rice cookers and so on.

arm CORTEX

2 Features

Core

- 32-bit Arm® Cortex®-M0+ processor core
- Up to 60 MHz operating frequency
- Single-cycle multiplication
- Integrated Nested Vectored Interrupt Controller (NVIC)
- 24-bit SysTick timer

The Cortex®-M0+ processor is a very low gate count, highly energy efficient processor that is intended for microcontroller and deeply embedded applications that require an area optimized, low-power processor. The processor is based on the ARMv6-M architecture and supports Thumb® instruction sets, single-cycle I/O ports, hardware multiplier and low latency interrupt respond time.

On-Chip Memory

- Up to 128 KB on-chip Flash memory for instruction/data and options storage
- Up to 16 KB on-chip SRAM
- Supports multiple booting modes

The Arm® Cortex®-M0+ processor accesses and debug accesses share the single external interface to external AHB peripherals. The processor accesses take priority over debug accesses. The maximum address range of the Cortex®-M0+ is 4 GB since it has a 32-bit bus address width. Additionally, a pre-defined memory map is provided by the Cortex®-M0+ processor to reduce the software complexity of repeated implementation by different device vendors. However, some regions are used by the Arm® Cortex®-M0+ system peripherals. Refer to the Arm® Cortex®-M0+ Technical Reference Manual for more information. Figure 3 ~ 4 in the Overview chapter shows the memory map of the HT32F54231/HT32F54241/HT32F54243/HT32F54253 series devices, including code, SRAM, peripheral and other pre-defined regions.

Flash Memory Controller – FMC

- Flash accelerator for maximum efficiency
- 32-bit word programming with In System Programming Interface (ISP) and In Application Programming (IAP)
- Flash protection capability to prevent illegal access

The Flash Memory Controller, FMC, provides all the necessary functions and pre-fetch buffer for the embedded on-chip Flash Memory. Since the access speed of the Flash Memory is slower than the CPU, a wide access interface with a pre-fetch buffer is provided for the Flash Memory in order to reduce the CPU waiting time which will cause CPU instruction execution delays. Flash Memory word program/page erase functions are also provided.

Reset Control Unit – RSTCU

- Supply supervisor
 - Power On Reset / Power Down Reset – POR / PDR
 - Brown Out Detector – BOD
 - Programmable Low Voltage Detector – LVD

The Reset Control Unit, RSTCU, has three kinds of reset, a power on reset, a system reset and an APB unit reset. The power on reset, known as a cold reset, resets the full system during power up. A system reset resets the processor core and peripheral IP components with the exception of the SW-DP controller. The resets can be triggered by external signals, internal events and the reset generators.

Clock Control Unit – CKCU

- External 4 to 16 MHz crystal oscillator
- External 32,768 Hz crystal oscillator
- Internal 8 MHz RC oscillator trimmed to $\pm 2\%$ accuracy at 5 V operating voltage and 25 °C operating temperature
- Internal 32 kHz RC oscillator
- Integrated system clock PLL
- Independent clock divider and gating bits for peripheral clock sources

The Clock Control Unit, CKCU, provides a range of oscillators and clock functions. These include a High Speed Internal RC oscillator (HSI), a High Speed External crystal oscillator (HSE), a Low Speed Internal RC oscillator (LSI), a Low Speed External crystal oscillator (LSE), a Phase Lock Loop (PLL), an HSE clock monitor, clock pre-scalers, clock multiplexers, APB clock divider and gating circuitry. The clocks of the AHB, APB and Cortex®-M0+ are derived from the system clock (CK_SYS) which can source from the HSI, HSE, LSI, LSE or system PLL. The Watchdog Timer and Real Time Clock (RTC) use either the LSI or LSE as their clock source.

Power Management Control Unit – PWRCU

- Single V_{DD} power supply: 2.5 V to 5.5 V
- Integrated 1.5 V LDO regulator for CPU core, peripherals and memories power supply
- Two power domains: V_{DD} and V_{CORE}
- Three power saving modes: Sleep, Deep-Sleep1 and Deep-Sleep2

Power consumption can be regarded as one of the most important issues for many embedded system applications. Accordingly the Power Control Unit, PWRCU, in the devices provide many types of power saving modes such as Sleep, Deep-Sleep1 and Deep-Sleep2 modes. These operating modes reduce the power consumption and allow the application to achieve the best trade-off between the conflicting demands of CPU operating time, speed and power consumption.

External Interrupt / Event Controller – EXTI

- Up to 16 EXTI lines with configurable trigger sources and types
- All GPIO pins can be selected as EXTI trigger source
- Source trigger type includes high level, low level, negative edge, positive edge or both edges
- Individual interrupt enable, wake-up enable and status bits for each EXTI line
- Software interrupt trigger mode for each EXTI line
- Integrated deglitch filter for short pulse blocking

The External Interrupt / Event Controller, EXTI, comprises 16 edge detectors which can generate a wake-up event or interrupt requests independently. Each EXTI line can also be masked independently.

Analog to Digital Converter – ADC

- 12-bit SAR ADC engine
- Up to 1 Msps conversion rate
- Up to 10 external analog input channels

A 12-bit multi-channel Analog to Digital Converter is integrated in the devices. There are multiplexed channels, which include up to 10 external analog signal channels and 3 internal channels. If the input voltage is required to remain within a specific threshold window, an Analog Watchdog function will monitor and detect these signals. An interrupt will then be generated to inform the device that the input voltage is not within the preset threshold levels. There are three conversion modes to convert an analog signal to digital data. The A/D Conversion can be operated in one shot, continuous and discontinuous conversion modes.

Comparator – CMP

- Rail-to-rail comparator
- Each comparator has configurable negative input used for flexible voltage selection
 - Dedicated I/O pin
 - Internal voltage reference provided by 8-bit scaler
- Programmable hysteresis
- Programming respond speed and consumption
- Comparator output can be routed to I/O or to multiple timers or ADC trigger inputs
- 8-bit scaler can be configurable to dedicated I/O for voltage reference
- Comparator has interrupt generation capability with wakeup from Sleep or Deep Sleep1 mode through the EXTI controller

The two general purpose comparators, CMP, are implemented within the devices. They can be configured either as standalone comparators or combined with the different kinds of peripheral IP. Each comparator is capable of asserting interrupts to the NVIC or waking up the CPU from the Sleep or Deep Sleep1 mode through the EXTI wakeup event management unit.

I/O Ports – GPIO

- Up to 54 GPIOs
- Port A, B, C, D are mapped as 16 external interrupts – EXTI
- Almost all I/O pins have a configurable output driving current

There are up to 54 General Purpose I/O pins, GPIO, for the implementation of logic input/output functions. Each of the GPIO ports has a series of related control and configuration registers to maximize flexibility and to meet the requirements of a wide range of applications.

The GPIO ports are pin-shared with other alternative functions to obtain maximum functional flexibility on the package pins. The GPIO pins can be used as alternative functional pins by configuring the corresponding registers regardless of the input or output pins. The external interrupts on the GPIO pins of the device have related control and configuration registers in the External Interrupt Control Unit, EXTI.

Motor Control Timer – MCTM

- 16-bit up/down auto-reload counter
- 16-bit programmable prescaler allowing counter clock frequency division by any factor between 1 and 65536
- Input Capture function
- Compare Match Output
- PWM waveform generation with Edge-aligned and Center-aligned Counting Modes
- Single Pulse Mode Output
- Complementary Outputs with programmable dead-time insertion
- Supports 3-phase motor control and hall sensor interface
- Break input to force the timer's output signals into a reset or fixed condition

The Motor Control Timer consists of one 16-bit up/down counter; four 16-bit Capture/Compare Registers (CCRs), one 16-bit Counter Reload Register (CRR), one 8-bit repetition counter and several control/status registers. It can be used for a variety of purposes including measuring the pulse widths of input signals or generating output waveforms such as compare match outputs, PWM outputs or complementary PWM outputs with dead-time insertion. The MCTM is capable of offering full functional support for motor control, hall sensor interfacing and brake input.

General-Purpose Timer – GPTM

- 16-bit up/down auto-reload counter
- Up to 4 independent channels
- 16-bit programmable prescaler allowing counter clock frequency division by any factor between 1 and 65536
- Input Capture function
- Compare Match Output
- PWM waveform generation with Edge-aligned and Center-aligned Counting Modes
- Single Pulse Mode Output
- Encoder interface controller with two inputs using quadrature decoder

The General Purpose Timer consists of one 16-bit up/down-counter, four 16-bit Capture/Compare Registers (CCRs), one 16-bit Counter Reload Register (CRR) and several control/status registers. They can be used for a variety of purposes including general time measurement, input signal pulse width measurement, output waveform generation such as single pulse generation or PWM output generation. The GPTM supports an Encoder Interface using a decoder with two inputs.

Single-Channel Timers – SCTM

- 16-bit up auto-reload counter
- One channel for each timer
- 16-bit programmable prescaler that allows division of the counter clock frequency by any factor between 1 and 65536
- Input Capture function
- Compare Match Output
- PWM waveform generation with Edge-aligned

The Single Channel Timer Module, SCTM, consists of one 16-bit up-counter, one 16-bit Capture/Compare Register (CCR), one 16-bit Counter Reload Register (CRR) and several control/status registers. It can be used for a variety of purposes including general timer, input signal pulse width measurement or output waveform generation such as PWM output.

Basic Function Timers – BFTM

- 32-bit compare match count-up counter – no I/O control features
- One shot mode – counting stops after a match condition
- Repetitive mode – restarts counter after a match condition

The Basic Function Timer is a simple count-up 32-bit counter designed to measure time intervals and generate a one shot or repetitive interrupts. The BFTM operates in two functional modes, repetitive or one shot mode. In the repetitive mode the BFTM restarts the counter when a compare match event occurs. The BFTM also supports a one shot mode which forces the counter to stop counting when a compare match event occurs.

Watchdog Timer – WDT

- 12-bit count-down counter with 3-bit prescaler
- Reset event for the system
- Programmable watchdog timer window function
- Register write protection function

The Watchdog Timer is a hardware timing circuit that can be used to detect system failures due to software malfunctions. It includes a 12-bit count-down counter, a prescaler, a WDT delta value register, a WDT operation control circuitry and a WDT protection mechanism. If the software does not reload the counter value before a Watchdog Timer underflow occurs, a reset will be generated when the counter underflows. In addition, a reset is also generated if the software reloads the counter when the counter value is greater than the WDT delta value. This means the counter must

be reloaded within a limited timing window using a specific method. The Watchdog Timer counter can be stopped while the processor is in the debug mode. There is a register write protect function which can be enabled to prevent it from changing the Watchdog Timer configuration unexpectedly.

Real Time Clock – RTC

- 24-bit count-up counter with a programmable prescaler
- Alarm function
- Interrupt and Wake-up event

The Real Time Clock, RTC, includes an APB interface, a 24-bit count-up counter, a control register, a prescaler, a compare register and a status register. The RTC counter is used as a wake-up timer to generate a system resume signal from the power saving modes.

Inter-Integrated Circuit – I²C

- Supports both master and slave modes with a frequency of up to 1 MHz
- Provides an arbitration function and clock synchronization
- Supports 7-bit and 10-bit addressing modes and general call addressing
- Supports slave multi-addressing mode using address mask function

The I²C is an internal circuit allowing communication with an external I²C interface which is an industry standard two-line serial interface used for connection to external hardware. These two serial lines are known as a serial data line, SDA, and a serial clock line, SCL. The I²C module provides three data transfer rates: (1) 100 kHz in the Standard mode, (2) 400 kHz in the Fast mode and (3) 1 MHz in the Fast plus mode. The SCL period generation register is used to setup different kinds of duty cycle implementations for the SCL pulse.

The SDA line which is connected directly to the I²C bus is a bi-directional data line between the master and slave devices and is used for data transmission and reception. The I²C also has an arbitration detection and clock synchronization function to prevent situations where more than one master attempts to transmit data to the I²C bus at the same time.

Serial Peripheral Interface – SPI

- Supports both master and slave modes
- Frequency of up to ($f_{\text{PCLK}}/2$) MHz for the master mode and ($f_{\text{PCLK}}/3$) MHz for the slave mode
- FIFO Depth: 8 levels
- Multi-master and multi-slave operation

The Serial Peripheral Interface, SPI, provides an SPI protocol data transmit and receive function in both master and slave modes. The SPI interface uses 4 pins, which are the serial data input and output lines MISO and MOSI, the clock line, SCK, and the slave select line, SEL. One SPI device acts as a master device which controls the data flow using the SEL and SCK signals to indicate the start of data communication and the data sampling rate. To receive a data byte, the streamed data bits are latched on a specific clock edge and stored in the data register or in the RX FIFO. Data

transmission is carried out in a similar way but in a reverse sequence. The mode fault detection provides a capability for multi-master applications.

Universal Synchronous Asynchronous Receiver Transmitter – USART

- Supports both asynchronous and clocked synchronous serial communication modes
- Asynchronous operating baud rate up to ($f_{\text{PCLK}}/16$) MHz and synchronous operating rate up to ($f_{\text{PCLK}}/8$) MHz
- Full duplex communication
- Fully programmable serial communication characteristics including
 - Word length: 7, 8 or 9-bit character
 - Parity: Even, odd or no-parity bit generation and detection
 - Stop bit: 1 or 2 stop bit generation
 - Bit order: LSB-first or MSB-first transfer
- Error detection: Parity, overrun and frame error
- Auto hardware flow control mode – RTS, CTS
- IrDA SIR encoder and decoder
- RS485 mode with output enable control
- FIFO Depth: 8-level for both receiver and transmitter

The Universal Synchronous Asynchronous Receiver Transceiver, USART, provides a flexible full duplex data exchange using synchronous or asynchronous data transfer. The USART is used to translate data between parallel and serial interfaces, and is commonly used for RS232 standard communication. The USART peripheral function supports four types of interrupt including Line Status Interrupt, Transmitter FIFO Empty Interrupt, Receiver Threshold Level Reaching Interrupt and Time Out Interrupt. The USART module includes a transmitter FIFO, TX FIFO, and receiver FIFO, RX FIFO. The software can detect a USART error status by reading the Line Status Register, LSR. The status includes the type and the condition of transfer operations as well as several error conditions resulting from Parity, Overrun, Framing and Break events.

Universal Asynchronous Receiver Transmitter – UART

- Asynchronous serial communication operating baud-rate up to $f_{\text{PCLK}}/16$ MHz
- Full duplex communication
- Fully programmable serial communication characteristics including
 - Word length: 7, 8 or 9-bit character
 - Parity: Even, odd or no-parity bit generation and detection
 - Stop bit: 1 or 2 stop bit generation
 - Bit order: LSB-first or MSB-first transfer
- Error detection: Parity, overrun and frame error

The Universal Asynchronous Receiver Transceiver, UART, provides a flexible full duplex data exchange using asynchronous transfer. The UART is used to translate data between parallel and serial interfaces, and is commonly used for RS232 standard communication. The UART peripheral function supports Line Status Interrupt. The software can detect a UART error status by reading the Line Status Register, LSR. The status includes the type and the condition of transfer operations as well as several error conditions resulting from Parity, Overrun, Framing and Break events.

Cyclic Redundancy Check – CRC

- Supports CRC16 polynomial: 0x8005,
 $X^{16} + X^{15} + X^2 + 1$
- Supports CCITT CRC16 polynomial: 0x1021,
 $X^{16} + X^{12} + X^5 + 1$
- Supports IEEE-802.3 CRC32 polynomial: 0x04C11DB7,
 $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Supports 1's complement, byte reverse & bit reverse operation on data and checksum
- Supports byte, half-word & word data size
- Programmable CRC initial seed value
- CRC computation executed in 1 AHB clock cycle for 8-bit data and 4 AHB clock cycles for 32-bit data

The CRC calculation unit is an error detection technique test algorithm and is used to verify data transmission or storage data correctness. A CRC calculation takes a data stream or a block of data as its input and generates a 16-bit or 32-bit output remainder. Ordinarily, a data stream is suffixed by a CRC code and used as a checksum when being sent or stored. Therefore, the received or restored data stream is calculated by the same generator polynomial as described above. If the new CRC code result does not match the one calculated earlier, that means the data stream contains a data error.

Peripheral Direct Memory Access – PDMA

- 6 channels with trigger source grouping
- 8-bit, 16-bit and 32-bit width data transfer
- Supports Address increment, decrement and fixed modes
- 4-level programmable channel priority
- Auto reload mode
- Supports trigger source
ADC, SPI, USART, UART, I²C, MCTM, GPTM and software request

The Peripheral Direct Memory Access controller, PDMA, moves data between the peripherals and the system memory on the AHB bus. Each PDMA channel has a source address, destination address, block length and transfer count. The PDMA can exclude the CPU intervention and avoid interrupt service routine execution. It improves system performance as the software does not need to connect each data movement operation.

Hardware Divider – DIV

- Signed/unsigned 32-bit divider
- Calculate in 8 clock cycles, load in 1 clock cycle
- Division by zero error flag

The divider is the truncated division and needs a software triggered start signal by using the control register “START” bit. After 8 clock cycles, the divider calculate complete flag will be set to 1, and if the divisor register data is zero, the division by zero error flag will be set to 1.

LED Controller – LEDC

- Driver 8-segment digital tubes up to 12
- Support 8-segment digital tube with common anode or common cathode
- Support frame interrupt
- Three frequency sources: LSI, LSE and PCLK
- The LED light on/off can be controlled by the deadtime setting

The LED Controller is used to drive 8-segment digital tubes. These devices can driver 8-segment digital tubes up to 12. Users can flexibly configure the pin position and number of the COMs according to the digital tubes in the application. In a complete frame period, t_{frame} , the enabled COMs will be scanned from small to large. Assuming that four 8-segment LEDs are used, the COM0, the COM5, the COM6 and the COM7 are enabled, the COM0, the COM5, the COM6 and the COM7 will be scanned successively in a complete frame period. The scanning time of each COM port is equal to $1/4 t_{frame}$, which is subdivided into deadtime duty and COM duty. Users can adjust the deadtime duty to change the LED brightness.

Touch Key

- Integrate the Key oscillators and the Reference oscillators. Every four Key oscillators are matched with one Reference oscillator for detection
- Reference oscillator internal capacitor support 1024 levels for frequency matching
- Three scan modes: Manual Mode, Auto Scan Mode and Periodic Auto Scan Mode
- Support detection in the Sleep, Deep-Sleep1 and Deep-Sleep2 modes
- Judge whether the Touch KEY is pressed or released through the hardware

All touch keys share a set of register array, which is used to store the reference oscillator capacitor setting and the touch key detection results. In addition, each touch key corresponds to a pair of upper / lower limit comparison registers, which are used to store the upper / lower limit threshold values. The hardware judges that an touch key is pressed or released according to the value stored in these registers.

Support detection in the Sleep, Deep-Sleep1 and Deep-Sleep2 modes. If the detected results conform to the condition that an touch key is pressed or released, the system will be wake-up and returned to normal mode.

Debug Support

- Serial Wire Debug Port – SW-DP
- 4 comparators for hardware breakpoints or code / literal patches
- 2 comparators for hardware watch points

Package and Operation Temperature

- 28-pin SSOP, 32 / 46-pin QFN and 48 / 64-pin LQFP packages
- Operation temperature range: -40 °C to +85 °C

5 Electrical Characteristics

Absolute Maximum Ratings

The following table shows the absolute maximum ratings of the device. These are stress ratings only. Stresses beyond absolute maximum ratings may cause permanent damage to the device. Note that the device is not guaranteed to operate properly at the maximum ratings. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Table 8. Absolute Maximum Ratings

Symbol	Parameter	Min.	Max.	Unit
V _{DD}	External Main Supply Voltage	V _{SS} - 0.3	V _{SS} + 5.5	V
V _{DDA}	External Analog Supply Voltage	V _{SSA} - 0.3	V _{SSA} + 5.5	V
V _{IN}	Input Voltage on I/O	V _{SS} - 0.3	V _{DD} + 0.3	V
T _A	Ambient Operating Temperature Range	-40	+85	°C
T _{STG}	Storage Temperature Range	-55	+150	°C
T _J	Maximum Junction Temperature	—	+125	°C

Note: The following guidelines are recommended to increase the stability of the crystal circuit of the HSE / LSE clock in the PCB layout.

1. The crystal oscillator should be located as close as possible to the MCU to keep the trace length as short as possible to reduce the parasitic capacitance.
2. Shield lines in the vicinity of the crystal by using a ground plane to isolate signals and reduce noise.
3. Keep the high frequency signal lines away from the crystal area to prevent the crosstalk adverse effects.

E_o	Offset Error	—	—	—	± 10	LSB
E_G	Gain Error	—	—	—	± 10	LSB

Note: 1. Guaranteed by design, not tested in production.

- Due to the A/D Converter input channel and GPIO pin-shared function design limitation, the V_{DDA} supply power of the A/D Converter has to be equal to the V_{DD} supply power of the MCU in the application circuit.
- The figure below shows the equivalent circuit of the A/D Converter Sample-and-Hold input stage where C_1 is the storage capacitor, R_1 is the resistance of the sampling switch and R_S is the output impedance of the signal source V_S . Normally the sampling phase duration is approximately, $3.5/f_{ADC}$. The capacitance, C_1 , must be charged within this time frame and it must be ensured that the voltage at its terminals becomes sufficiently close to V_S for accuracy. To guarantee this, R_S is not allowed to have an arbitrarily large value.

Figure 11. ADC Sampling Network Model

The worst case occurs when the extremities of the input range (0 V and V_{REF}) are sampled consecutively. In this situation a sampling error below 1/4 LSB is ensured by using the following equation:

$$R_S < \frac{3.5}{f_{ADC} C_1 \ln(2^{N+2})} - R_1$$

Where f_{ADC} is the ADC clock frequency and N is the ADC resolution (N = 12 in this case). A safe margin should be considered due to the pin/pad parasitic capacitances, which are not accounted for in this simple model.

If in a system where the A/D Converter is used, there are no rail-to-rail input voltage variations between consecutive sampling phases, R_S may be larger than the value indicated by the equation above.
