# 1 General Description

The Holtek HT32F52344/52354 devices are high performance, low power consumption 32-bit microcontrollers based around an Arm® Cortex®-M0+ processor core. The Cortex®-M0+ is a next-generation processor core which is tightly coupled with Nested Vectored Interrupt Controller (NVIC), SysTick timer, and including advanced debug support.

The devices operate at a frequency of up to 60 MHz with a Flash accelerator to obtain maximum efficiency. It provides up to 128 KB of embedded Flash memory for code/data storage and 8 KB of embedded SRAM memory for system operation and application program usage. A variety of peripherals, such as Hardware Divider DIV, ADC, CMP, I<sup>2</sup>C, UART, SPI, MCTM, GPTM, SCTM, BFTM, CRC-16/32, RTC, WDT, PDMA, EBI, USB2.0 FS, SW-DP (Serial Wire Debug Port), etc., are also implemented in the devices. Several power saving modes provide the flexibility for maximum optimization between wakeup latency and power consumption, an especially important consideration in low power applications.

The above features ensure that the devices are suitable for use in a wide range of applications, especially in areas such as white goods application controllers, power monitors, alarm systems, consumer products, handheld equipment, data logging applications, motor controllers and so on.

**arm** CORTEX

## 2 Features

### Core

- 32-bit Arm® Cortex®-M0+ processor core
- Up to 60 MHz operating frequency
- Single-cycle multiplication
- Integrated Nested Vectored Interrupt Controller (NVIC)
- 24-bit SysTick timer

The Cortex®-M0+ processor is a very low gate count, highly energy efficient processor that is intended for microcontroller and deeply embedded applications that require an area optimized, low-power processor. The processor is based on the ARMv6-M architecture and supports Thumb® instruction sets, single-cycle I/O ports, hardware multiplier and low latency interrupt respond time.

### On-chip Memory

- Up to 128 KB on-chip Flash memory for instruction/data and options storage
- 8 KB on-chip SRAM
- Supports multiple boot modes

The Arm® Cortex®-M0+ processor accesses and debug accesses share the single external interface to external AHB peripherals. The processor accesses take priority over debug accesses. The maximum address range of the Cortex®-M0+ is 4 GB since it has a 32-bit bus address width. Additionally, a pre-defined memory map is provided by the Cortex®-M0+ processor to reduce the software complexity of repeated implementation by different device vendors. However, some regions are used by the Arm® Cortex®-M0+ system peripherals. Refer to the Arm® Cortex®-M0+ Technical Reference Manual for more information. Figure 2 in the Overview chapter shows the memory map of the HT32F52344/52354 series devices, including code, SRAM, peripheral and other pre-defined regions.

### Flash Memory Controller – FMC

- 32-bit word programming with In System Programming (ISP) and In Application Programming (IAP)
- Flash protection capability to prevent illegal access

The Flash Memory Controller, FMC, provides all the necessary functions and pre-fetch buffer for the embedded on-chip Flash Memory. Since the access speed of the Flash Memory is slower than the CPU, a wide access interface with a pre-fetch buffer are provided for the Flash Memory in order to reduce the CPU waiting time which will cause CPU instruction execution delays. Flash Memory word programming/page erase functions are also provided.

## Reset Control Unit – RSTCU

- Supply supervisor:
  - Power on Reset / Power down Reset – POR / PDR
  - Brown-out Detector – BOD
  - Programmable Low Voltage Detector – LVD

The Reset Control Unit, RSTCU, has three kinds of reset, a power on reset, a system reset and an APB unit reset. The power on reset, known as a cold reset, resets the full system during power up. A system reset resets the processor core and peripheral IP components with the exception of the SW-DP controller. The resets can be triggered by external signals, internal events and the reset generators.

## Clock Control Unit – CKCU

- External 4 to 16 MHz crystal oscillator
- External 32.768 kHz crystal oscillator
- Internal 8 MHz RC oscillator trimmed to  $\pm 2$  % accuracy at 3.3 V operating voltage and 25 °C operating temperature
- Internal 32 kHz RC oscillator
- Integrated clock PLL and USB PLL
- Independent clock divider and gating bits for peripheral clock sources

The Clock Control Unit, CKCU, provides a range of oscillator and clock functions. These include a High Speed Internal RC oscillator (HSI), a High Speed External crystal oscillator (HSE), a Low Speed Internal RC oscillator (LSI), a Low Speed External crystal oscillator (LSE), a Phase Lock Loop (PLL), a HSE clock monitor, clock pre-scalers, clock multiplexers, APB clock divider and gating circuitry. The AHB, APB and Cortex®-M0+ clocks are derived from the system clock (CK\_SYS) which can come from the HSI, HSE, LSI, LSE or system PLL. The Watchdog Timer and Real Time Clock (RTC) use either the LSI or LSE as their clock source.

## Power Management Control Unit – PWRCU

- Single  $V_{DD}$  power supply: 1.65 V to 3.6 V
- Integrated 1.5 V LDO regulator for CPU core, peripherals and memories power supply
- $V_{DD}$  power supply for RTC
- Two power domains:  $V_{DD}$ , 1.5 V
- Four power saving modes: Sleep, Deep-Sleep1, Deep-Sleep2, Power-Down

Power consumption can be regarded as one of the most important issues for many embedded system applications. Accordingly the Power Control Unit, PWRCU, in these devices provides many types of power saving modes such as Sleep, Deep-Sleep1, Deep-Sleep2 and Power-Down mode. These operating modes reduce the power consumption and allow the application to achieve the best trade-off between the conflicting demands of CPU operating time, speed and power consumption.

## External Interrupt/Event Controller – EXTI

- Up to 16 EXTI lines with configurable trigger source and type
- All GPIO pins can be selected as EXTI trigger source
- Source trigger type includes high level, low level, negative edge, positive edge, or both edges
- Individual interrupt enable, wakeup enable and status bits for each EXTI line
- Software interrupt trigger mode for each EXTI line
- Integrated deglitch filter for short pulse blocking

The External Interrupt/Event Controller, EXTI, comprises 16 edge detectors which can generate a wake-up event or interrupt requests independently. Each EXTI line can also be masked independently.

## Analog to Digital Converter – ADC

- 12-bit SAR ADC engine
- Up to 1 Msps conversion rate
- Up to 12 external analog input channels

A 12-bit multi-channel ADC is integrated in these devices. There are multiplexed channels, which include 12 external analog signal channels and 2 internal channels which can be measured. If the input voltage is required to remain within a specific threshold window, an Analog Watchdog function will monitor and detect these signals. An interrupt will then be generated to inform the device that the input voltage is not within the preset threshold levels. There are three conversion modes to convert an analog signal to digital data. The ADC can be operated in one shot, continuous and discontinuous conversion modes.

The internal voltage reference (VREF) provides a stable reference voltage output for the ADC and Comparators. VREF is internally connected to the ADC\_IN15 input channel. The precise voltage of VREF is individually measured for each part by Holtek in during production test.

## Comparator – CMP

- Two Rail-to-rail comparators
- Each comparator has configurable negative input used for flexible voltage selection
  - Dedicated I/O pin
  - Internal voltage reference provided by 8-bit scaler
- Programmable hysteresis
- Programming speed and consumption
- Comparator output can be output to I/O or to multiple timer or ADC trigger inputs
- 8-bit Scaler can be configurable to dedicated I/O for voltage reference
- Comparator has interrupt generation capability with wakeup from Sleep or Deep Sleep modes through the EXTI controller

The two general purpose comparators (CMP) are implemented within the devices. They can be configured either as standalone comparators or combined with the different kinds of peripheral IP. Each comparator is capable of asserting interrupts to the NVIC or waking up the CPU from Deep Sleep mode through EXTI wakeup event management unit.

## I/O Ports – GPIO

- Up to 54 GPIOs
- Port A, B, C, D are mapped as 16 external interrupts – EXTI
- Almost all I/O pins have configurable output driving current

There are up to 54 General Purpose I/O pins, GPIO, named PA0 ~ PA15, PB0 ~ PB15, PC0 ~ PC15 and PD0 ~ PD5 for the implementation of logic input/output functions. Each of the GPIO ports has a series of related control and configuration registers to maximize flexibility and to meet the requirements of a wide range of applications.

The GPIO ports are pin-shared with other alternative functions to obtain maximum functional flexibility on the package pins. The GPIO pins can be used as alternative functional pins by configuring the corresponding registers regardless of the input or output pins. The external interrupts on the GPIO pins of the device have related control and configuration registers in the External Interrupt Control Unit, EXTI.

## Motor Control Timer – MCTM

- One 16-bit up, down, up/down auto-reload counter
- 16-bit programmable prescaler allowing counter clock frequency divided by any factor between 1 and 65536
- Input Capture function
- Compare Match Output
- PWM waveform generation with Edge-aligned and Center-aligned Counting Modes
- Single Pulse Mode Output
- Complementary Outputs with programmable dead-time insertion
- Break input to force the timer's output signals into a reset or fixed condition

The Motor Control Timer consists of one 16-bit up/down-counter, four 16-bit Capture/Compare Registers (CCRs), one 16-bit Counter Reload Register (CRR), one 8-bit repetition counter and several control/status registers. It can be used for a variety of purposes including measuring the pulse width of input signals or generating output waveforms such as compare match outputs, PWM outputs or complementary PWM outputs with dead-time insertion. The MCTM is capable of offering full functional support for motor control, hall sensor interfacing and break input.

## General-Purpose Timer – GPTM

- One 16-bit up, down, up/down auto-reload counter
- Up to 4 independent channels for each timer
- 16-bit programmable prescaler allowing the counter clock frequency divided by any factor between 1 and 65536
- Input Capture function
- Compare Match Output
- PWM waveform generation with Edge-aligned and Center-aligned Counting Modes
- Single Pulse Mode Output
- Encoder interface controller with two inputs using quadrature decoder

The General-Purpose Timer consists of one 16-bit up/down-counter, four 16-bit Capture/Compare Registers (CCRs), one 16-bit Counter Reload Register (CRR) and several control/status registers. They can be used for a variety of purposes including general time measurement, input signal pulse width measurement, output waveform generation such as single pulse generation or PWM output generation. The GPTM supports an Encoder Interface using a decoder with two inputs.

## Single Channel Timer – SCTM

- One 16-bit up and auto-reload counter
- One channel for each timer
- 16-bit programmable prescaler allowing the counter clock frequency divided by any factor between 1 and 65536
- Input Capture function
- Compare Match Output
- PWM waveform generation with Edge-aligned
- Single Pulse Mode Output

The Single Channel Timer consists of one 16-bit up-counter, one 16-bit Capture/Compare Register (CCR), one 16-bit Counter-Reload Register (CRR) and several control/status registers. It can be used for a variety of purposes including general timer, input signal pulse width measurement or output waveform generation such as single pulse generation or PWM output.

## Basic Function Timer – BFTM

- One 32-bit compare match count-up counter – no I/O control features
- One shot mode – counting stops after compare match occurs
- Repetitive mode – restart counter when compare match occurs

The Basic Function Timer is a simple 32-bit up-counting counter designed to measure time intervals and generate a one shot or repetitive interrupts. The BFTM operates in two functional modes, repetitive and one shot modes. In the repetitive mode, the BFTM restarts the counter when a compare match event occurs. The BFTM also supports a one shot mode which forces the counter to stop counting when a compare match event occurs.

## Watchdog Timer – WDT

- 12-bit down counter with 3-bit prescaler
- Reset event for the system
- Programmable watchdog timer window function
- Register write protection function

The Watchdog Timer is a hardware timing circuit that can be used to detect system failures due to software malfunctions. It includes a 12-bit count-down counter, a prescaler, a WDT delta value register, WDT operation control circuitry and a WDT protection mechanism. If the software does not reload the counter value before a Watchdog Timer underflow occurs, a reset will be generated when the counter underflows. In addition, a reset is also generated if the software reloads the

counter when the counter value is greater than the WDT delta value. This means the counter must be reloaded within a limited timing window using a specific method. The Watchdog Timer counter can be stopped while the processor is in the debug mode. There is a register write protection function which can be enabled to prevent it from changing the Watchdog Timer configuration unexpectedly.

## Real Time Clock – RTC

- 24-bit up-counter with a programmable prescaler
- Alarm function
- Interrupt and Wake-up event

The Real Time Clock, RTC, includes an APB interface, a 24-bit count-up counter, a control register, a prescaler, a compare register and a status register. Most of the RTC circuits are located in the  $V_{DD}$  power domain except for the APB interface. The APB interface is located in the  $V_{DD15}$  power domain. Therefore, it is necessary to be isolated by the ISO signal that comes from the power control unit when the  $V_{DD15}$  power domain is powered off, that is when the device enters the Power-Down mode. The RTC counter is used as a wakeup timer to generate a system resume or interrupt signal from the MCU power saving modes.

## Inter-integrated Circuit – I<sup>2</sup>C

- Supports both master and slave modes with a frequency of up to 1 MHz
- Provides an arbitration function and clock synchronization
- Supports 7-bit and 10-bit addressing modes and general call addressing
- Supports slave multi-addressing mode with address mask function

The I<sup>2</sup>C is an internal circuit allowing communication with an external I<sup>2</sup>C interface which is an industry standard two line serial interface used for connection to external hardware. These two serial lines are known as a serial data line, SDA, and a serial clock line, SCL. The I<sup>2</sup>C module provides three data transfer rates: 100 kHz in the Standard mode, 400 kHz in the Fast mode and 1 MHz in the Fast plus mode. The SCL period generation register is used to setup different kinds of duty cycle implementations for the SCL pulse.

The SDA line which is connected directly to the I<sup>2</sup>C bus is a bi-directional data line between the master and slave devices and is used for data transmission and reception. The I<sup>2</sup>C also has an arbitration detect function and clock synchronization to prevent situations where more than one master attempts to transmit data to the I<sup>2</sup>C bus at the same time.

## Serial Peripheral Interface – SPI

- Supports both master and slave modes
- Frequency of up to ( $f_{PCLK}/2$ ) MHz for the master mode and ( $f_{PCLK}/3$ ) MHz for the slave mode
- FIFO Depth: 8 levels
- Multi-master and multi-slave operation

The Serial Peripheral Interface, SPI, provides a SPI protocol data transmit and receive function in both master and slave modes. The SPI interface uses 4 pins, which are the serial data input and

output lines MISO and MOSI, the clock line, SCK, and the slave select line, SEL. One SPI device acts as a master device which controls the data flow using the SEL and SCK signals to indicate the start of data communication and the data sampling rate. To receive a data byte, the streamed data bits are latched on a specific clock edge and stored in the data register or in the RX FIFO. Data transmission is carried out in a similar way but in a reverse sequence. The mode fault detection provides a capability for multi-master applications.

## Universal Asynchronous Receiver Transmitter – UART

- Asynchronous serial communication operating baud-rate clock frequency up to ( $f_{\text{CLK}}/16$ ) MHz
- Full duplex communication
- Fully programmable serial communication characteristics including:
  - Word length: 7, 8 or 9-bit character
  - Parity: Even, odd or no-parity bit generation and detection
  - Stop bit: 1 or 2 stop bit generation
  - Bit order: LSB-first or MSB-first transfer
- Error detection: Parity, overrun and frame error

The Universal Asynchronous Receiver Transceiver, UART, provides a flexible full duplex data exchange using asynchronous transfer. The UART is used to translate data between parallel and serial interfaces, and is commonly used for RS232 standard communication. The UART peripheral function supports Line Status Interrupt. The software can detect a UART error status by reading the Line Status Register, LSR. The status includes the type and the condition of transfer operations as well as several error conditions resulting from Parity, Overrun, Framing and Break events.

## Cyclic Redundancy Check – CRC

- Support CRC16 polynomial: 0x8005,  
 $X^{16}+X^{15}+X^2+1$
- Support CCITT CRC16 polynomial: 0x1021,  
 $X^{16}+X^{12}+X^5+1$
- Support IEEE-802.3 CRC32 polynomial: 0x04C11DB7,  
 $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X+1$
- Supports 1's complement, byte reverse & bit reverse operation on data and checksum
- Supports byte, half-word & word data size
- Programmable CRC initial seed value
- CRC computation executed in 1 AHB clock cycle for 8-bit data and 4 AHB clock cycles for 32-bit data
- Supports PDMA to complete a CRC computation of a block of memory

The CRC calculation unit is an error detection technique test algorithm which is used to verify data transmission or storage data correctness. A CRC calculation takes a data stream or a block of data as its input and generates a 16-bit or 32-bit output remainder. Ordinarily, a data stream is suffixed by a CRC code and used as a checksum when being sent or stored. Therefore, the received or restored data stream is calculated by the same generator polynomial as described above. If the new CRC code result does not match the one calculated earlier, that means the data stream contains a data error.

## Peripheral Direct Memory Access – PDMA

- 6 channels with trigger source grouping
- 8-bit, 16-bit and 32-bit width data transfer
- Supports Address increment, decrement or fixed mode
- 4-level programmable channel priority
- Auto reload mode
- Supports trigger source:
  - ADC, SPI, UART, I<sup>2</sup>C, MCTM, GPTM and software request

The Peripheral Direct Memory Access controller, PDMA, moves data between the peripherals and the system memory on the AHB bus. Each PDMA channel has a source address, destination address, block length and transfer count. The PDMA can exclude the CPU intervention and avoid interrupt service routine execution. It improves system performance as the software does not need to connect each data movement operation.

## Hardware Divider – DIV

- Signed/unsigned 32-bit divider
- Operation in 8 clock cycles, load in 1 clock cycle
- Divide by zero error Flag

The divider is the truncated division and needs a software triggered start signal by using the control register “START” bit. After 8 clock cycles, the divider calculate complete flag will be set to 1, and if the divisor register data is zero, the divide by zero error flag will be set to 1.

## External Bus Interface – EBI

- Programmable interface for various memory types
- Translate the AHB transactions into the appropriate external device protocol
- Individual chip select signal for each memory bank
- Programmable timing to support a wide range of devices
- Automatic translation when AHB transaction width and external memory interface width are different
- Write buffer to decrease stalling of the AHB write burst transaction
- Multiplexed and non-multiplexed address and data line configurations
  - Up to 21 address lines
  - Up to 16-bit data bus width

The external bus interface is able to access external parallel interface devices such as SRAM, Flash and LCD modules. The interface is memory mapped into the CPU internal address map. The data and address lines are multiplexed in order to reduce the number of pins required to connect to the external devices. The read/write timing of the bus can be adjusted to meet the timing specification of the external devices. Note the interface only supports asynchronous 8-bit or 16-bit bus interface.

## Universal Serial Bus Device Controller – USB

- Complies with USB 2.0 full-speed (12 Mbps) specification
- On-chip USB full-speed transceiver
- 1 control endpoint (EP0) for control transfer
- 3 single-buffered endpoints for bulk and interrupt transfer
- 4 double-buffered endpoints for bulk, interrupt and isochronous transfer
- 1,024 byte EP\_SRAM used as the endpoint data buffers

The USB device controller is compliant with the USB 2.0 full-speed specification. There is one control endpoint known as Endpoint 0 and seven configurable endpoints. A 1024-byte EP\_SRAM is used as the endpoint buffer. Each endpoint buffer size is programmable using corresponding registers, which provides maximum flexibility for various applications. The integrated USB full-speed transceiver helps to minimize overall system complexity and cost. The USB also contains suspend and resume features to meet low-power consumption requirement.

## Debug Support

- Serial Wire Debug Port – SW-DP
- 4 comparators for hardware breakpoint or code / literal patch
- 2 comparators for hardware watch points

## Package and Operation Temperature

- 33/46-pin QFN and 48/64-pin LQFP packages
- Operation temperature range: -40 °C to 85 °C

## Absolute Maximum Ratings

The following table shows the absolute maximum ratings of the device. These are stress ratings only. Stresses beyond absolute maximum ratings may cause permanent damage to the device. Note that the device is not guaranteed to operate properly at the maximum ratings. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

**Table 5. Absolute Maximum Ratings**

Symbol	Parameter	Min.	Max.	Unit
V <sub>DD</sub>	External Main Supply Voltage	V <sub>SS</sub> - 0.3	V <sub>SS</sub> + 3.6	V
V <sub>DDA</sub>	External Analog Supply Voltage	V <sub>SSA</sub> - 0.3	V <sub>SSA</sub> + 3.6	V
V <sub>IN</sub>	Input Voltage on I/O	V <sub>SS</sub> - 0.3	V <sub>DD</sub> + 0.3	V

Note: The following guidelines are recommended to increase the stability of the crystal circuit of the HSE / LSE clock in the PCB layout.

1. The crystal oscillator should be located as close as possible to the MCU to keep the trace length as short as possible to reduce the parasitic capacitance.

2. Shield lines in the vicinity of the crystal by using a ground plane to isolate signals and reduce noise.
3. Keep the high frequency signal lines away from the crystal area to prevent the crosstalk adverse effects.

$E_O$	Offset Error	—	—	—	$\pm 10$	LSB
$E_G$	Gain Error	—	—	—	$\pm 10$	LSB

Note: 1. Guaranteed by design, not tested in production.

- Due to the A/D Converter input channel and GPIO pin-shared function design limitation, the  $V_{DDA}$  supply power of the A/D Converter has to be equal to the  $V_{DD}$  supply power of the MCU in the application circuit.
- The figure below shows the equivalent circuit of the A/D Converter Sample-and-Hold input stage where  $C_i$  is the storage capacitor,  $R_i$  is the resistance of the sampling switch and  $R_S$  is the output impedance of the signal source  $V_S$ . Normally the sampling phase duration is approximately,  $3.5/f_{ADC}$ . The capacitance,  $C_i$ , must be charged within this time frame and it must be ensured that the voltage at its terminals becomes sufficiently close to  $V_S$  for accuracy. To guarantee this,  $R_S$  is not allowed to have an arbitrarily large value.

**Figure 8. ADC Sampling Network Model**

The worst case occurs when the extremities of the input range (0 V and  $V_{REF}$ ) are sampled consecutively. In this situation a sampling error below 1/4 LSB is ensured by using the following equation:

$$R_S < \frac{3.5}{f_{ADC} C_i \ln(2^{N+2})} - R_i$$

Where  $f_{ADC}$  is the ADC clock frequency and  $N$  is the ADC resolution ( $N = 12$  in this case). A safe margin should be considered due to the pin/pad parasitic capacitances, which are not accounted for in this simple model.

If, in a system where the A/D Converter is used, there are no rail-to-rail input voltage variations between consecutive sampling phases,  $R_S$  may be larger than the value indicated by the equation above.

$f_{SCK}$	SPI Master Output SCK Clock Frequency	Master mode SPI peripheral clock frequency $f_{PCLK}$	—	—	$f_{PCLK}/2$	MHz
$t_{SCK(H)}$ $t_{SCK(L)}$	SCK Clock High and Low Time	—	$t_{SCK}/2 - 2$	—	$t_{SCK}/2 + 1$	ns
$t_{V(MO)}$	Data Output Valid Time	—	—	—	5	ns
$t_{H(MO)}$	Data Output Hold Time	—	2	—	—	ns
$t_{SU(MI)}$	Data Input Setup Time	—	5	—	—	ns
$t_{H(MI)}$	Data Input Hold Time	—	5	—	—	ns
<b>SPI Slave Mode</b>						
$f_{SCK}$	SPI Slave Input SCK Clock Frequency	Slave mode SPI peripheral clock frequency $f_{PCLK}$	—	—	$f_{PCLK}/3$	MHz
Duty <sub>SCK</sub>	SPI Slave Input SCK Clock Duty Cycle	—	30	—	70	%
$t_{SU(SEL)}$	SEL Enable Setup Time	—	$3 t_{PCLK}$	—	—	ns
$t_{H(SEL)}$	SEL Enable Hold Time	—	$2 t_{PCLK}$	—	—	ns
$t_{A(SO)}$	Data Output Access Time	—	—	—	$3 t_{PCLK}$	ns
$t_{DIS(SO)}$	Data Output Disable Time	—	—	—	10	ns
$t_{V(SO)}$	Data Output Valid Time	—	—	—	25	ns
$t_{H(SO)}$	Data Output Hold Time	—	15	—	—	ns
$t_{SU(SI)}$	Data Input Setup Time	—	5	—	—	ns
$t_{H(SI)}$	Data Input Hold Time	—	4	—	—	ns

Note: 1.  $f_{SCK}$  is SPI output/input clock frequency and  $t_{SCK} = 1/f_{SCK}$ .  
2.  $f_{PCLK}$  is SPI peripheral clock frequency and  $t_{PCLK} = 1/f_{PCLK}$ .

## USB Characteristics

The USB interface is USB-IF certified - Full Speed.

Table 25. USB DC Electrical Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{DD}$	USB Operating Voltage	—	3.0	—	3.6	V
$V_{DI}$	Differential Input Sensitivity	$ USB_{DP} - USB_{DM} $	0.2	—	—	V
$V_{CM}$	Common Mode Voltage Range	—	0.8	—	2.5	V
$V_{SE}$	Single-ended Receiver Threshold	—	0.8	—	2.0	V
$V_{OL}$	Pad Output Low Voltage	1.5 k $\Omega$ $R_L$ to $V_{DD33}$	0	—	0.3	V
$V_{OH}$	Pad Output High Voltage		2.8	—	3.6	V
$V_{CRS}$	Differential Output Signal Cross-point Voltage		1.3	—	2.0	V
$Z_{DRV}$	Driver Output Resistance	—	—	10	—	$\Omega$
$C_{IN}$	Transceiver Pad Capacitance	—	—	—	20	pF

Note: 1. Guaranteed by design, not tested in production.

2. The USB functionality is ensured down to 2.7 V but not for the full USB electrical characteristics which will experience degradation in the  $V_{DD}$  voltage range of 2.7 to 3.0 V.

3.  $R_L$  is the resistor load connected to the USB driver USB $_{DP}$ .

**Figure 12. USB Signal Rise Time and Fall Time and Cross-Point Voltage ( $V_{CRS}$ ) Definition**

**Table 26. USB AC Electrical Characteristics**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_R$	Rise time	$C_L = 50 \text{ pF}$	4	—	20	ns
$t_F$	Fall time	$C_L = 50 \text{ pF}$	4	—	20	ns
$t_{R/F}$	Rise time / fall time matching	$t_{R/F} = t_R / t_F$	90	—	110	%
